Course Description:

This course is at even semester of third year B Tech computer science and engineering. It is a core course in computer science and may be pre requisites for other courses in computer science. It covers basics of regular languages, finite automata, grammar, languages and conceptsTuring machines.

Prerequisite: Discrete structures and basics of mathematics

Course Outcomes: After the end of this course students will able to

- **CLO1 Design**³ finite automata to recognize a regular language.
- **CLO2 Design**³ a Simplified Context Free Grammar for any language.
- CLO3 Describe² Push Down Automata and Context Free Language.
- **CLO4 Construct⁵** Turing Machine to recognize a given language.

Syllabus (Theory)

Units	Description	Hrs.
Ι	Mathematical Induction, Regular Languages & Finite Automata:	07
	Introduction to Finite Automata, Types of Proofs, The Principle of	
	Mathematical Induction Type of Proof, Descriptive and Recursive	
	Definitions of Language, Regular Languages and Regular Expressions,	
	Deterministic Finite Automata (DFA): Definition and Representation,	
	Unions, Intersection & Complements of Regular Languages, Equivalence	
	of FA's.Non-Deterministic Finite Automata: Definition, Representation,	
	Acceptance of Language, Equivalence of NFA and FA. Non-Deterministic	
	Finite Automata (NFA) and NFA with null transitions: Need, Definition,	
	Representation, Acceptance of Language, NFA and NFA - Null.	

Department of Computer Science and Engineering

Structure and Contents for Third Year B. Tech. Computer Science and Engineering Program

AY 2024-25

II Kleene's Theorem:

Kleene's Theorem Part I and II Statements and Proofs, Minimum State of FA for a Regular Language : Minimizing Number of States In Finite

III Grammars and Languages Part - I Introduction to Grammar, Types of Grammars, Regular Grammar and DFA, Context Free Grammar: Definition, Representation, Types of Derivation, Derivation of String and Ambiguity. Simplification of Context FreeGrammar: Eliminating useless and dead variables from a CFG, Eliminating Null Production and Unit productions from CFG.

IV Grammars and Languages Part - II

Context Free Language (CFL) - Definition, Closure Properties of CFL -Union, Concatenation and *'s, of CFLs, Writing CFG for a given language. Chomsky Normal Form (CNF): Definition, Need, Convert the Given CFG to CNF Form: Algorithm and Solving Examples.

V Push Down Automata and Context Free Language

Definition, Representation, Types of PDA: Deterministic PDA and Non-Deterministic PDA, Types of Acceptance, Instantons Descriptions, Design of PDA, Equivalence of CFG's and PDAs,

CFL's and non CFL's: Pumping Lemma: Statement and Proof, Solving Examples, Properties of Context Free Languages

VI Turing Machines:

Introduction, Definition, Representation, A String Acceptance by TM, Instantons Descriptions for TM, Design of Turing Machine for given Language, Variations in Turing Machines, Turing Machine and Computing Function.

Tutorial

One hour per week per batch tutorial is to be utilized to ensure that students have properly learnthe topics covered in the lectures. It should comprise of minimum 8-10 tutorials. Students of different batches should perform different tutorials based on the following guidelines-

- 1.Writing decrypting and recursive definition of language, solving problems on DFA and regular expressions.
- 2. Solving problems on equivalence of NFA and DFA, NFA and NFA Null.
- 3. Kleene's Theorem Part I and Part II.
- 4. Minimum State of FA for a regular language, minimizing number of states in FA

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of the principles, techniques, and methodologies involved in the design, analysis, and evaluation of algorithms. Through theoretical discussions, practical implementations, and problem-solving exercises, students will develop a strong foundation in algorithmic thinking, enabling them to tackle complex computational challenges effectively

Prerequisite: - Data Structures.

Course Outcomes: After the end of this course students will able to

CLO1 Solve³ real time problems based on different algorithmic strategies.

CLO2 Analyse⁴ the complexity of different algorithms based on different techniques

CLO3 Classify⁴ real time problems into different algorithmic techniques.

CLO4 Compare⁴ different algorithms based on different techniques

Syllabus (Theory)

Uni	ts Description	Hours
I.	Introduction to Algorithms: Introduction to Algorithm, Growth of	07
	Functions - Solving Recursive Equation: Substitution method, Iteration Method Master Method. Divide and Conquer: Finding maximum and Minimum, Sele Stassen's matrix Multiplication.	
II.	Greedy Algorithms : Greedy Approach-General Method, Knapsack	07
	Problem, Minimum cost spanning tree- Prim's and Kruskal's algorithm, Single S	ource

Shortest Path.

AY 2024-25

- III. Dynamic Programming : Principle of Optimality, All Pair Shortest Path, 07Longest Common Sequence, Optimal binary search algorithm, Travelling SalesmanProblem, Reliability Design
- IV. Backtracking: General Method, 8-Queen Problem, Sum-of-Subnet 07

Problem, Hamilton Cycle, Branch and Bound Knapsack Problem, Travelling Salesman Problem.

- V. String Matching and Parallel Algorithm: Simple String matching, The 07 naive string-matching algorithm, The Rabin-Karp algorithm, PRAM Computation Model, Fundamental techniques, MESH-Computation model, Packet Routing, Fundamental techniques, HYPERCUBE- Computation model, PPR Routing, Fundamental techniques.
- VI. NP-Hard and NP-Complete Problems : Basic concept of N, NP, NP- 07

Hard,NP-Complete,NP-HardGraphProblems-CliqueDecisionProblem(CDP), NodeCoverDecisionProblem (NCDP), Chromatic number decisionproblem (CNDP), DirectedHamiltonianCycle (DHC), Traveling salesmanProblem(TSP), AND/ORGraphdecisionProblem (AOG).

Practical Syllabus

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines-

- 1. Write programs based on recursive algorithms.
- 2. Write program for selection problem.
- 3. Write program to implement Knapsack problem using greedy technique.
- 4. Write program to implement Prim's/Kruskal's algorithm.
- 5. Write program to implement Single-Source Shortest Path.
- 6. Write program to implement All- Pair Shortest Path.
- 7. Write program to implement Travelling Salesman problem.
- 8. Write program to implement 8-Queens problem.
- 9. Write program to implement Hamiltonian cycle problem.
- 10. Write program to implement Knapsack using Branch and Bound technique.
- 11. Write program to implement Naive string-matching algorithm.
- 12. Write program to implement the Rabin-Karp algorithm.
- 13. Write program to implement List ranking in PRAM.
- 14. Write program to implement Prefix Computation in MESH.

Course Description:

The objective of this short course is to introduce third-year Computer Science and Engineering students to the fundamental concepts, syntax, and applications of the Python programming language. Through a combination of theoretical explanations, hands-on coding exercises, and practical projects, students will acquire proficiency in Python programming and develop the skills necessary to leverage Python for various computational tasks

Prerequisite: - Knowledge of Object oriented Programming Concepts.

Syllabus (Theory)

Units	Description	Hours
I.	Basic concepts and functions in Python: Introduction to Python, the application areas of Python, Python Basics, Data types and variables, Data input, Comments, String, List, Tuple, Dictionary, Set, Control Statements, Range, Strings, introduction to function, define a function, pass arguments, different type for arguments, Local and global variables, return a value from function, Return multiple values, Lambda Functions.	07
П.	Object Oriented concepts in Python: Class definition, creating objects, Constructors, accessing attributes, Built-in class attributes, Destructors, Inheritance, Overriding, Overloading, what is exception? Python built-in exceptions, Try-Except-Finally, raise exceptions, User defined exception.	08
III.	File and Database Handling: Reading, Writing, File manipulations, Directories, performing different database operations like Select, Insert, Update, Delete using MySql and Python connectivity	07
IV.	NumPy and Pandas: Create, access, modify, and sort multidimensional NumPy arrays (ndarrays), Load	08

Third Year Department of Computer Science and Engineering

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

and save ndarrays, Use slicing, Boolean indexing, and set operations to select change subsets of an ndarray, understand difference between a view and a copy ndarray, perform element-wise operations on ndarrays, Use broadcasting perform operations on ndarrays of different sizes, Create, access, and modify t main objects in Pandas, Series and DataFrames, Perform arithmetic operations Series and DataFrames, Load data into a DataFrame, Deal with Not a Numb (NaN) values.

Course Outcomes: After the end of this course students will able to

- **CLO1 Explain**² data types and control statements in Python.
- **CLO2** Make use of³ functions and object oriented concepts to develop basic programs in Python.
- **CLO3 Apply3** file handling techniques and CRUD operations for given problems in Python.
- **CLO4 Construct³** solutions to different problems using NumPy and pandas.

Syllabus (Practical)

Four hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics. It should comprise of minimum of 13-15 experiments. Students of different batches should implement different programs based on following guidelines.

- 1. Introduction to Python, Setup, working in Python shell and Jupyter Notebook, Basic I/O.
- 2. Implement list, tuple, set and dictionary.
- 3. Implement String methods.
- 4. Implement Iterator, Conditionals and Loops.
- 5. Implement functions and recursive functions.
- 6. Implement lambda functions.
- 7. Implement a basic Object Oriented program using Classes, Objects.
- 8. Implement Inheritance and Method Overriding.
- 9. Implement Exception handling.
- 10. Implement File handling: Open, close, read, write and append data using file.
- 11. Implement programs based on Python and MySql Database connectivity.
- 12. Implement Python programs using NumPy. (e. g. Multiplication of two Matrices in Single line)
- 13. Implement Python programs based on Pandas library.

Course Description:

A wireless sensor network is an emerging area that employs a network of sensor nodes that are tiny in size and battery operated. They are required to be used very power efficiently so that network lifetime is optimized and provide reliable communication to the base station. By learning this subject the students will gain the recent trends of wireless sensor networks, their design limitations and challenges.

Prerequisite: Computer Networking

Course Outcomes: After the end of this course students will be able to

- **CLO1 Demonstrate**³ basic concept of WSNs, supportive technologies and radio transmission issues
- **CLO2 Compare**⁴ requirements of access control protocols and media access control techniques
- **CLO3** Apply ² different strategies used to develop routing protocols for WSN
- **CLO4 Determine**⁴ operating systems for wireless sensor networks and design.

Syllabus (Theory)

Units

Description

Hours

Introduction and Overview of Wireless Sensor Networks
 Introduction, Basic Overview of the Technology, Applications of 7
 Wireless Sensor Networks, Another Taxonomy of WSN Technology

II. Basic Wireless Sensor Technology

Sensor Node Technology, Hardware and Software, Sensor Taxonomy,WN Operating environment, , Wireless Transmission Technology andSystems, Radio Technology Primer, Available Wireless Technologies,Medium Access Control Protocols for Wireless Sensor Networks

Course Description:

This course serves as an introduction to the field of Artificial Intelligence (AI) for computer engineering students. It covers foundational concepts, algorithms, and applications of AI, providing students with the necessary knowledge and skills to understand, design, and implement AI systems.

Course Learning Outcomes:

At the end of this course students will able to

- **CLO1 Explain**² concepts and principles of Artificial Intelligence.
- **CLO2** Apply ³ common AI techniques and algorithms for given problem.
- **CLO3** Apply ³ AI techniques to solve engineering problems
- **CLO4** Explain⁴ real-world applications of AI across various domains.

SYLLABUS

UNITS

DESCRIPTION

- I Definition of AI, birth of AI, brief history, Turing test, Types of environment, Types of agents, PEAS(Performance measure , Environment, Actuators, Sensors),
- II Introduction to searching,

State Space, SAGP (State, Action, Goal test, Path cost), DFS, BFS (Completeness, Time complexity, Space complexity, Optimality), Heuristics, Local Search Algorithm, Hill Climbing. Applications of Artificial Intelligence in real word.

Course Description: This course is at odd semester of Third year B Tech Technology for Computer Science Engineering. It is a foundation course in Numerical method and Fuzzy Mathematics and may be pre requisites for other courses. It covers solution of algebraic and transcendental equation by different methods, Numerical differentiation and Numerical integration, Introduction to fuzzy set and Fuzzy equations.

Course Outcomes: At the end of this course students will able to-

- **CLO1 Explain**² fundamental concepts of digital image processing require for image enhancement.
- **CLO2** Choose³ algorithms to build solutions to the real world computer vision problems.
- **CLO3 Demonstrate**³ different techniques of image segmentation with justification.
- **CLO4** Anlyze⁴ different Image Processing and text processing techniques.

Syllabus (Theory)

I Digital Image Fundamental Introduction: Concept, Fundamental Steps and Components of Image Processing System, Image Acquisition, A simple image model, Sampling and Quantization, Imaging Geometry, Different types of digital images II Image Transforms

Image Transforms 2D systems and Necessary Mathematical preliminaries, 2D Orthogonal and Unitary Transforms, 1-D DFT, KL-Transforms, Cosine, Hadamard Transforms, Introduction to Wavelet transforms.

III Image Enhancement

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines

Sr. No

Experiment Description

- 1 Demonstrate the concept of sampling and quantization through practical examples
- 2 Implement 2D orthogonal and unitary transforms using MATLAB or similar software. Compute 1-D Discrete Fourier Transform (DFT) of images
- 3 Implement basic gray level transformations and histogram processing techniques
- 4 Implement edge detection algorithms using first and second-order derivatives, LoG, and Canny edge detector
- 5 Implement active contour and watershed transform algorithms
- 6 Implement region growing and region splitting and merging algorithms for segmentation
- 7 Implement gray level to color transformations.
- 8 Implement color transformations, smoothing, and sharpening techniques to color images
- 9 Implement texture analysis techniques using statistical methods such as auto-correlation and co-occurrence matrices.
- 10 Calculate edge density and direction in textures

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with a foundational understanding of digital forensics principles, techniques, and methodologies. Through theoretical discussions, practical exercises, and case studies, students will develop the skills necessary to investigate digital crimes, analyze digital evidence, and preserve the integrity of digital information.

Prerequisite: - Students should have knowledge of Networking.

Course Outcomes: After the end of this course students will able to

CLO1	Explain ² the	role of digital forensics.
------	--------------------------	----------------------------

- **CLO2 Demonstrate** ³ the computing requirements appropriate to solve given problem.
- **CLO3 Classify** ⁴ the network forensics and methods of investigation using digital forensics techniques.
- CLO4 Adapt⁶ professional, ethical, legal, security and social issues and responsibilities.

Syllabus (Theory)

Units Description

I Introduction

Introduction of Cybercrime: Types, The Internet spawns crime, Worms versus viruses, Computers' roles in crimes, Introduction to digital forensics, Introduction to Incident - Incident Response Methodology – Steps - Activities in Initial Response, Phase after detection of an incident.

SGU

Third Year Department of Computer Science and Engineering

AME/P/00

07

07

07

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

II Initial Response and forensic duplication

Initial Response & Volatile Data Collection from Windows system - Initial Response & Volatile Data Collection from Unix system – Forensic Duplication: Forensic duplication: Forensic Duplicates as Admissible Evidence, Forensic Duplication Tool Requirements, Creating a Forensic. Duplicate/Qualified Forensic Duplicate of a Hard Drive.

III Preserving and Recovering Digital Evidence:

File Systems: FAT, NTFS - Forensic Analysis of File Systems – Storage Fundamentals: Storage Layer, Hard Drives Evidence Handling: Types of Evidence, Challenges in evidence handling, Overview of evidence handling

IV Network Forensics:

Intrusion detection; Different Attacks in network, analysis Collecting Network Based Evidence - Investigating Routers - Network Protocols -Email Tracing- Internet Fraud procedure

V System investigation:

Data Analysis Techniques - Investigating Live Systems (Windows & Unix) Investigating, Hacker Tools - Ethical Issues – Cybercrime.

VI Bodies of law:

Constitutional law, Criminal law, Civil law, Administrative regulations, Levels of law: Local laws, State laws, Federal laws, International laws, Levels of culpability: Intent, Knowledge, Recklessness, Negligence Level and burden of proof: Criminal versus civil cases, Vicarious liability, Laws related to computers: CFAA, DMCA, CAN Spam, etc.

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines

Sr. No

Experiment Description

- 1 Acquisition of volatile memory using various tools like Volatility, etc.
- 2 Setup of memory forensic environment and extract various artifacts from memory dump and analyze the memory dump, Using different tools like Volatility, LiME, etc
- 3 Windows artifact analysis using different forensic tools, which includes MRU, link file, USB analysis, Prefetch analysis, shell bag, web cache etc.,

Third Year Department of Computer Science and Engineering

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

- 4 Analysis of UNIX based and other operating systems using EnCase, FTK, Autopsy and similar tools.
- 5 Perform forensic analysis of Multimedia Files and CCTV Footage analysis.
- 6 Using APKTool to reverse an Android application, Auditing Android applications.
- 7 Perform the following on different Android Image files:
 - Using a custom recovery android image.
 - Using AFLogical to extract contacts, calls, and text messages.
 - Dumping application databases manually.
 - Logging the logcat and using backup to extract an application's data.
- 8 Developing your first iOS app and running apps on iDevice.
- 9 Pentest using iOS Simulator and identifying the Flaws in Local Storage
- 10 Perform traffic analysis for iOS Applications by: Intercepting traffic over HTTP, HTTPS, iOS Simulator
- 11 Perform physical acquisition of iOS devices physical and Data backup acquisition using Elcomsoft iOS Forensic Toolkit (EIFT), Open source and free tools.

				Component Theory	Exam FA	Weightage 50	r ass 70			
3	-									

Course Description:

The course aims to introduce students to the principles, techniques, and challenges of Parallel and Distributed Computing. It covers various aspects such as parallel programming platforms, parallel algorithm design principles, and CUDA programming model, analytical modeling of parallel programs, dense matrix algorithms, graph algorithms, and search algorithms for discrete optimization problems.

Prerequisite: Computer Networking, Wireless Adhoc Networks

Course Outcomes: After the end of this course students will be able to

CLO1 Describe² the Scope and Challenges of Parallel and Distributed Computing.

CLO2 Implementing³ parallel algorithms, including decomposition techniques, load balancing strategies.

CLO3 Develop⁴ parallelized code for GPUs (Graphics Processing Units), including isolating data, allocating memory, transferring data between host and device.

CLO4 Analyze⁴ Performance and Scalability of Parallel Programs

Syllabus (Theory) Description

Units

I Introduction:

Scope , issues, applications and challenges of Parallel and Distributed Computing, Parallel Programming Platforms: Implicit Parallelism: Trends in Microprocessor Architectures, Dichotomy of Parallel Computing Platforms, Physical Organization, Communication Costs in Parallel Machines, Routing Mechanisms for Interconnection Networks, GPU, coprocessing

 II Principles of Parallel Algorithm Design: Decomposition Techniques, 07 Characteristics of Tasks and Interactions, Mapping Techniques for Load Balancing.

Third Year Department of Computer Science and Engineering

AME/P/00

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

III **CUDA programming model:**

Overview of CUDA, Isolating data to be used by parallelized code, API function to allocate memory on parallel computing device, to transfer data, Concepts of Threads, Blocks, Grids, Developing a kernel function to be executed by individual threads, Execution of kernel function by parallel threads, transferring data back to host processor with API

Function.

IV **Analytical Modeling of Parallel Programs:**

Sources of Overhead in Parallel Programs, Performance Metrics for Parallel Systems, The Effect of Granularity on Performance, Scalability of Parallel Systems, Minimum Execution Time and Minimum Cost- Optimal Execution Time

V **Dense Matrix Algorithms:**

Matrix-Vector Multiplication, Matrix-Matrix Multiplication, Issues in Sorting on Parallel Computers, Bubble Sort and Variants, Quick Sort, Other Sorting Algorithms

Graph Algorithms:

Minimum Spanning Tree: Prim's Algorithm, Single-Source Shortest Paths: Dijkstra's Algorithm, All-Pairs Shortest Paths, Transitive Closure, Connected Components, Algorithms for Sparse Graph

Search Algorithms for Discrete Optimization Problems: Sequential VI Search Algorithms, Parallel Depth-First Search, Parallel Best-First Search, Speedup Anomalies in Parallel Search Algorithms

Laboratory Work : To Implement the algorithms with the help of CUDA programming using parallel and distributed programming techniques

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines-

- 1. Parallel Odd-Even Transposition Sort
- 2. Mandelbrot Set Computation
- 3. N-Body Simulation
- 4. Heat Distribution Simulation
- 5. Sample MPI program in C
- 6. Implement simple cluster using master and slave node
- 7. Divide and conquer parallel computing program using C

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with an advanced understanding of database management systems (DBMS) and related concepts. Building upon foundational knowledge acquired in previous database courses, this course delves into advanced topics and emerging trends in the field of database management

Prerequisite: Database System and Programming Experience

Course Outcomes: After the end of this course students will be able to

CLO1: Classify² various types of database architectures based on the domain of application.

CLO2: Implement ³ advanced query writing techniques with PL/SQL to solve database problems

CLO3: Analyze4 the use of MongoDB and XML databases for information retrieval.

CLO4: Elaborate⁶ the effectiveness of NoSQL and Big Data in specific database applications

Syllabus (Theory)

Units I

Description ORDBMS and OODBMS

Hrs.

07

Structured data types, Operations on structured data, Encapsulation and ADTs, Inheritance, Objects, OIDS and Reference types, Database design for an ORDBMS. Object identity, Nested collections. Introduction to Object Database Management Group (ODMG), Object Definition Language (ODL) and Object Query Language (OQL)- SELECT and sub queries. Comparison of RDBMS, ORDBMS and OODBMS.

II Advanced SQL

PL/SQL- A Basic introduction, Functions and Procedure, Packages, Synonyms, Database Links, Embedded SQL and Dynamic SQL. Database 07

Third Year Department of Computer Science and Engineering

AME/P/00

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

Design: systems development life cycle, database life cycle, DBMS Software Selection: top- down versus bottom-up design

III Information Retrieval & XML data

Introduction to information retrieval, Indexing for Text search. Overview and structure of XML data, Data model for XML, XMLDTD's, Domain specific DTD's, Querying XML data, XML Applications

IV NoSQL & Introduction to Big Data

Types of digital data: Structured, unstructured and semi-structured. Definition of Big Data. Why big data. Traditional Business Intelligence (BI) vs Big Data. NoSQL: Types, advantages and use of NoSQL in industry. Comparison of SQL, NoSQL and NewSQL. Introduction to Hadoop: Features and key advantages of Hadoop. The Hadoop ecosystem: HDFS and map reduce. Introduction to interacting with Hadoop eco system: Pig, Hive, Scoop, HBase.

V MongoDB - A NoSQL Database

Definition and need of MongoDB. JavaScript programming, Datatypes in MongoDB. MongoDB Query Language: Insert, save methods, add/remove fields to/from documents, arrays, aggregate functions, Mapreduce function, Mongo import, Mongo export.

VI Current Trends In Advanced Databases

Introduction to different types of databases and application areas: Multimedia Database, Cloud Databases, Spatial Databases, Temporal Databases, Mobile Databases, Deductive databases

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines:

- 1. Develop an application using multi-valued attributes, complex types, procedures and functions in ORDBMS.
- 2. Implement a database application to study PL/SQL concepts and features.
- 3. Embed PL/SQL in a high-level host language such as C and demonstrate a transaction application.
- 4. Create XML, XML schemas, DTD for any database application and implement queries using XQuery and XPath. This can be done in two experiments.
- 5. Installation of Hadoop.
- 6. Performing queries to demonstrate use of HDFS and Mapreduce.
- 7. Design database schemas and implement queries using Hive/ Hbase.

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of compiler design principles, techniques, and methodologies. Compiler design plays a crucial role in translating high-level programming languages into executable code, making it an essential aspect of software development and system programming. Through theoretical discussions, practical exercises, and hands-on projects, students will develop the skills necessary to design, implement, and optimize compilers for various programming languages.

Prerequisite: Basics of programming in C, Fundamentals of Theory of Computation:

Course Outcomes: After the end of this course students will be able to

- **CLO2 Apply³** parsing techniques to parse a string
- **CLO3** Simplify⁴ intermediate code using semantic analysis

string, Error Recovery in Predictive Parsing.

CLO4 Apply³ different code generation techniques to optimize the code.

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines:

- 1. Remove white spaces (space, tab) and comments from the C/ C++ Program.
- 2. Implement a program to construct a Symbol Table for the tokens.
- 3. Demonstrate the working of Lex Tool used in Lexical Analyzer.
- 4. Implement a program to eliminate left recursion and Left factor of the given input grammar to remove the ambiguity.
- 5. Implement a program to apply First and Follow functions of LL(1) class of a grammar.
- 6. Implement a program to demonstrate the working of Top Down parsers.
- 7. Implement a program to demonstrate the working of LR(0) or SLR
- 8. Implement a program to demonstrate working of LALR or Canonical LR.
- 9. Demonstrate the working of Yacc Tool used in Syntax Analyzer.
- 10. Implement a three address code generator program for the given expression.
- 11. Implement a program to construct DAG (Directed Acyclic Graph) for expressions
- 12. Implement a program to construct DAG (Directed Acyclic Graph) for basic blocks.
- 13. Implement a program to identify the Basic blocks, and loops in a given three address code

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of machine learning principles, algorithms, and applications. Machine learning has emerged as a transformative technology with wide-ranging applications in various domains, including computer vision, natural language processing, robotics, healthcare, finance, and more. Through theoretical discussions, practical exercises, and hands-on projects, students will develop the skills necessary to apply machine learning techniques to solve real-world problems and lay the foundation for further study or research in the field **Prerequisite:** Basic concepts of computer algorithm

Course Outcomes: After the end of this course students will be able to

- **CLO1 Classify**³ machine learning techniques.
- **CLO2** Implement³ machine learning techniques suitable for problem solving.
- **CLO3** Solve³ the problem using various Deep learning techniques
- **CLO4 Describe** ² various basic concept of Artificial Neural Networks

Syllabus (Theory)

Description

Hrs.

06

I Introduction

Units

Supervised and unsupervised learning, Hypothesis space, Applications of machine learning, Feature selection and extraction, Principal component analysis.

II Supervised learning:

Bias-Variance Dichotomy, Linear regression in one variable: Cost Function, Gradient descent; Linear Regression with Multiple Variables: Gradient descent; Logistic regression, KNN. Bayesian Learning and Decision Trees, SVM, Ensemble Methods

Third Year Department of Computer Science and Engineering

AME/P/00

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

III **Unsupervised learning:**

Clustering algorithms: K-means, hierarchical clustering, DBSCAN Dimensionality reduction techniques: Principal Component Analysis (PCA), t-distributed Stochastic Neighbor Embedding (t-SNE) Association rule learning: Apriori algorithm Evaluation metrics for unsupervised learning models: silhouette score, Davies-Bouldin index

IV **Deep Learning:**

Introduction to neural networks: perceptron's, activation functions Building blocks of deep learning: layers, neurons, weights, biases

Popular deep learning architectures: Convolutional Neural Networks (CNNs) for image classification, Recurrent Neural Networks (RNNs) for sequential data, and their variants

V **Evaluation of Learning Algorithms:**

Cross-validation, learning curves, and statistical hypothesis testing. \Box Ensemble learning methods: bagging, boosting, stacking Hyper parameter tuning techniques: grid search, random search, Bayesian optimization

Machine Learning based Artificial Neural Networks: VI

Fundamentals of Artificial Neural Networks, Perceptron, Model of Neuron in an ANN, Backpropagation.

Course Description:

Π

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of mobile computing principles, technologies, and applications. Mobile computing has become increasingly pervasive in modern society, with smartphones, tablets, and other mobile devices playing a central role in communication, commerce, and entertainment. Through theoretical discussions, practical exercises, and hands-on projects, students will explore the key concepts, challenges, and opportunities in mobile computing, enabling them to design, develop, and deploy mobile applications effectively.

Prerequisite: Network Technologies

Course Outcomes: After the end of this course students will be able to

- **CLO1 Illustrate**² the basics concept of mobile telecommunication systems
- **CLO2** Identify³ the generations of telecommunication systems in wireless networks
- **CLO3 Categorize**⁴ the functionality of MAC, network layer,
 - Transport and Application layers
- **CLO4 Construct**³ a mobile application using Android/blackberry/ios/Windows SDK

Syllabus (Theory)

Units	Description	Hrs
		•
Ι	Introduction and Overview of Wireless Sensor Networks Introduction, Basic Overview of the Technology, Applications of Wireless Sensor Networks, Another Taxonomy of WSN Technology	07

Basic Wireless Sensor Technology:
Sensor Node Technology, Hardware and Software, Sensor Taxonomy,
WN Operating environment, , Wireless Transmission Technology and
Systems, Radio Technology Primer, Available Wireless Technologies,
Medium Access Control Protocols for Wireless Sensor Networks

Third Year Department of Computer Science and Engineering

AME/P/00

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program III 07 **Routing Protocols for Wireless Sensor Networks:** Data Dissemination and Gathering, Routing Challenges and Design Issues in Wireless Sensor Networks, Routing Strategies, Transport Control Protocols for Wireless Sensor Networks, Traditional Transport Control Protocols, Transport Protocol Design Issues, Examples of Existing Transport Control Protocols. IV 07 **WSN Middleware Principles:** Middleware Architecture, Network Management for Wireless Sensor Networks, Network Management Requirements, Traditional Network Management Models, Network Management Design Issues, Example of Management Architecture: MANNA V 07 **Operating Systems for Wireless Sensor Networks:** Operating System Design Issues, Examples of Operating Systems, TinyOS, Mate, MagnetOS, MANTIS, OSPM, EYES OS, SenOS, EMERALDS, PicOS VI 07 **Performance and Traffic Management:** Introduction, Background, WSN Design Issues, MAC Protocols, Routing Protocols, Transport Protocols, Performance Modeling of WSNs, Performance Metrics, Basic Models, Network Models, Case Study: Simple Computation of the System Life Span

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure that students have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines-

- 1. To check orthogonality of two codes. Generation of Walsh codes.
- 2. To implement Code Division Multiple Access (CDMA).
- 3. To study frequency reuse.
- 4. To create a MIDletsuite with two MIDlets.
- 5. To study ChoiceGroup class and its implementation in J2ME.
- 6. To study Canvas class and its implementation in J2ME.
- 7. Write WML page using various tags such as select and option tags.
- 8. Write a WML page to display an image and to accept input from the user.
- 9. Study Assignment 1: Detailed study of Bluetooth
- 10. Study Assignment 2 : Detailed study of Wireless Application Protocol

Course Description:

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of intelligent systems, including the theories, algorithms, and applications of artificial intelligence (AI) and machine learning (ML). Intelligent systems play a crucial role in various domains, including robotics, natural language processing, computer vision, and expert systems. Through theoretical discussions, practical exercises, and hands-on projects, students will develop the skills necessary to design, implement, and evaluate intelligent systems for solving complex computational problems

Prerequisite: Programming & Data Structures.

Course Outcomes: After the end of this course students will be able to

- **CLO1** Make use of³ different types of Agents in Artificial Intelligence to solve problems
- CLO2 Implement ⁴ different Search Strategies for appropriate real-world problem-

Solving

- **CLO3** Analyze⁴ different Knowledge, Reasoning and Learning and planning scheme for appropriate Problem-Solving
- **CLO4 Differentiate**⁴ between different Expert systems and there Applications.

Units	Syllabus (Theory) Description	Hrs.
I	Introduction Definition, Introduction to AI,- Future of Artificial Intelligence Characteristics of Intelligent Agents, Structure of Intelligent agents, Types of Agents, Agent Environments PEAS representation for an Agent	07
II	Problem Solving: Solving problems by searching, Problem formulation, Search Strategies, Uninformed Search Techniques-DFS, BFS, Uniform cost search, Informed	07

search methods-Best First Search, heuristic Functions, Hill Climbing, A*, CSP

Syllabus (Practical)

Two hours per week per batch practical is to be utilized for writing programs to ensure thatstudents have properly learnt the topics covered in the lectures. It should comprise of minimum 10-12 experiments. Students of different batches should implement different programs based on the following guidelines-

Third Year Department of Computer Science and Engineering

AME/P/00

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

Suggested List of practical

- 1. Write a program to make use of pre-processing libraries-standardization & normalization and predefined libraries e.g., PANDAS, NumPI
- 2. Write a program to implement Single Player Game (Using Heuristic Function)
- 3. Write a program for diagnosis the diseases
- 4. Implementation of A* Algorithm
- 5. Implementation of Tic-Tac-Toe game problem
- 6. Implementing WUMPUS world problem.
- 7. Implementation of Water jug Problem
- 8. Implementation of 8 puzzle problem
- 9. Implementation of Traveling salesman problem
- 10. Solve any problem using depth first search
- 11. Write a Program to find factorial of given number
- 12. Write a Program to detect species of Animal

Course Objective:

The objective of this course is to provide third-year Computer Science and Engineering students with a comprehensive understanding of high-performance computing (HPC) principles, techniques, and methodologies. High-performance computing plays a crucial role in solving computationally intensive problems efficiently, spanning various domains such as scientific simulations, numerical analysis, data analytics, and machine learning.

Prerequisite: - Computer Algorithm

Course Outcomes: After the end of this course students will able to

- **CLO1 Distinguish**⁴ algorithms in the computational area for efficient programming in modern computer architectures
- **CLO2** Make use of³ suitable algorithms for scientific computations
- **CLO3** Make use of³ tools for performance optimization and debugging
- **CLO4** Compare⁴ parallel processing architectures based on their performance

Course Outcomes: After the end of this course students will able to

- **CLO1 Analyze**⁴ the basic concepts and services of cloud computing.
- **CLO2 Demonstrate**² large scale distributed systems and cloud applications
- **CLO3 Apply³** security in cloud applications
- CLO4 Design⁵ Cloud services for IOT Application

Syllabus (Theory) Description

I Introduction to Cloud Computing

Importance of Cloud Computing, Characteristics, Pros and Cons of Cloud Computing, Migrating into the Cloud, Seven-step model of migration into a Cloud, Trends in Computing. Cloud Service Models: SaaS, PaaS, IaaS, Storage. Cloud Architecture: Cloud Computing Logical Architecture, Developing Holistic Cloud Computing Reference Model, Cloud System

Architecture, and Cloud Deployment Models.

II Data Storage and Cloud Computing

Data Storage: Introduction to Enterprise Data Storage, Direct Attached
Storage, Storage Area Network, Network Attached Storage, Data Storage
Management, File System, Cloud Data Stores, Using Grids for Data Storage.
Cloud Storage: Data Management, Provisioning Cloud storage, Data
Intensive Technologies for Cloud Computing. Cloud Storage from LANs to
WANs: Cloud Characteristics, Distributed Data Storage.

III Virtualization in Cloud Computing

Course Description:

This course is intended for students from any discipline who require an understanding of design

Thinking for brand, product, and service development. Students will learn a series of design thinking concepts, methods and techniques that are used to bring about innovation in business and in the social sector.

Prerequisite:

Units

Course Outcomes: After the end of this course students will be able to

- **CLO1 Illustrate**² the art perspectives, ideas, concepts, and solutions related to the design and execution of projects using design thinking principles and IPR.
- **CLO2 Prepare**⁶ the mindset and discipline of systemic inspiration driven by a desire to identify new sources of ideas, and new models especially outside their regular working.
- **CLO3** Categorize⁴ different Indian Designs Law in creativity and Innovations practices. Transport and Application layers
- **CLO4 Propose**⁶ a concrete, feasible, viable and relevant innovation project/challenge

Syllabus (Theory)

Description

I Introduction

What is Different About Design thinking? Design Thinking Skills Principles of Design Thinking, The Basis for Design Thinking, The Design Thinking Team, Design Thinking Workshops and Meetings – Exercises and case based discussions

II Listening and Empathizing Techniques:

Listening and Empathizing Techniques – observation – structured open ended approach - , Design Thinking Frameworks, Ideation tools – brainstorming, innovation heuristics, behaviour models, overcoming cognitive fixedness – Exercises and case based discussions

07

Hrs .

Third Year Department of Computer Science and Engineering

AME/P/00

07

Structure and Contents for T.Y. B. Tech. Computer Science and Engineering Program

III

Design Thinking – Empathy map and Story telling:

Use of Diagrams and Maps in Design Thinking – Empathy map. Affinity diagram, mind map, journey map, combining ideas into complex innovation concepts. Story telling – improvisation, scenario planning, development of scenarios, evaluation tools, frog design and prototyping - Exercises and case-based discussions Assess developer and user perspectives for bias – apply frameworks to strengthen communication – sustain a culture of innovation.

IV Intellectual Property Management:

Intellectual Property Management. Market Capitalization, Intellectual Capital (IC), Components of Intellectual Capital, Tangible and Intangible Assets of Firms, Goodwill, Linkage between IC, Corporate Strategy, and Profits, Relationship between Intellectual Capital and Intellectual Property, Knowledge Economy and the need for Intellectual Property Management, Enforcement of IPRs – IP and constitution of India, World intellectual Property Organization (WIPO) –WTO/TRIPS Agreement – India and the TRIPS Agreement – Patent law in India- IP & Start up policies in India.

Types of Intellectual Property trademarks:

Various Types of Intellectual Property trademarks, Copyrights, Patents, Trade Secrets, and Industrial Design, International IP Treaties/Agreements on IP Rights, Types of Patents, Patenting Advantage, Offensive and Defensive IP Strategies, Case studies – Procedure for obtaining patent – Rights of a patentee – Limitations on Particular's Rights – Revocation of patent for Non – working Transfer of patent – Infringement of patent – Global Innovation Indexs and IP Management, Intellectual Property Strategies in Indian Context Universities, CSIR and Commercial Firms

VI

V

Indian Designs Law:

Indian Designs Law – Meaning of Design Registration and Prohibitions – Copyright in Designs –Design and Penalties – Steps for filing an Application – Copyright law in India –Owner of the copyright – Rights of Broad Casters and Performers – Registration of Copyright – Assignment, Licensing and Transmission – Infringement – International Copyright and Copyright Societies -Trade Mark Law in India – Functions of a Trade Mark – Registration of Trade Mark Exploiting Trade Mark – Infringement – Offenses and Penalties 07
